

Python dictionary methods

Clear()

Clear removes all the elements from a dictionary.

Syntax: Dictionary.clear()

Copy()

Copy returns a copy of the dictionary.

Syntax: Dictionary.copy()

Fromkeys()

Fromkeys returns a dictionary with the specified keys and the specified value.

Syntax: Dictionary.fromkeys(keys, value)

Get()

Get returns the value of the item with the specified key.

Syntax: Dictionary.get(keyname, value)

Items()

Items returns a view object. The view object contains the key-value pairs of the dictionary, as tuples in a list.

Syntax: Dictionary.items()

Keys()

Keys returns a view object. The view object contains the keys of the dictionary, as a list.

Syntax: Dictionary.keys()

Pop()

Pop removes the specified item from the dictionary.

Syntax: Dictionary.pop(keyname, value)

Popitem()

Popitem removes the item that was last inserted into the dictionary.

Syntax: Dictionary.popitem()
